Manuscript Title: Risk-Controlled Spatio-Temporal Graph Learning for Anti-Money Laundering Under Extreme Imbalance and Topological Camouflage

Target Journal: Expert Systems with Applications (Elsevier)

- Unified C-STGB framework for AML under extreme class imbalance ($<0.05\%$).
- Continuous tri-band temporal attention prunes 65.9% of camouflage edges.
- Class-conditional conformal risk control guarantees $\geq 99.0\%$ coverage.
- Outperforms deep GNNs by $+43.5$ pp macro F1 across 14 financial networks.
- Fast-Path streaming inference achieves 0.45 ms single-event audit latency.
